THE AI CONTENT AGENCY BLUEPRINT

Join my telegram for more sauce like this:
t.me/mikoslab

How to Print Money Selling AI Videos in 2025

every business knows they need videos for ads and social media

but production companies charge $10k+ per video

most can't afford it, so they're sitting there watching competitors win with content while they do nothing

you can just run an AI content agency to solve this problem

here's the complete blueprint:

POSITIONING YOUR AI VIDEO SERVICE

you need to position AI videos as premium solutions, not budget alternatives

most people fuck this up by competing on price

"hey we're cheaper than a production company"

that's vendor thinking

here's how you actually position this:

tie it to their pain point

your client isn't looking for "a video"

they're looking to solve a problem:

- their ads aren't converting
- their competitors are outpacing them with content
- they're spending $10k per video and can't test enough angles
- they need 50 pieces of content per month but can't afford a full production team

that's what you sell against

speed + volume = competitive advantage

traditional filmmaking takes weeks and costs thousands per video

with AI you can deliver:

- multiple variations in days, not weeks
- 10-20 different hooks tested instead of 1
- faster iteration cycles so they can adapt to what's working
- the ability to test new campaigns without blowing their entire budget on one shoot

don't just pitch "it's cheaper"

pitch "you can now outpace every competitor because you have 10x the creative firepower"

the gain they actually get:

while their competitors are waiting 3 weeks for one video from a production company, your client is:

- testing 15 different angles
- finding what converts
- scaling the winners
- already profitable before their competitor's single video even launches

that's the real value

speed isn't just about saving time

it's about competitive advantage in a market where whoever tests fastest wins

position yourself as the person who gives them that advantage

not the cheap alternative, but the premium solution that actually makes them money faster

THE AI PRODUCTION WORKFLOW

this is where most people fuck up

they think AI just magically makes good videos

it doesn't

you need a system

MAKING GREAT AI IMAGES

before you touch VEO, you need reference-quality images

here's the workflow I use 90% of the time:

STEP 1: Find Your Reference

- go to Shotdeck (it's a database of movie frames)
- search for the vibe you want (moody boardroom, luxury car, whatever)
- download 3-5 frames that match your vision

STEP 2: Reverse Engineer the Prompt

- upload reference to gemini
- ask: "analyze this image's composition, lighting, camera angle, and color grading"
- copy that description word for word

STEP 3A: For Objects/Environments (no people)

- take that description to Midjourney
- add "--ar 16:9 --style raw" at the end
- generate 4 variations
- pick the best one

STEP 3B: For Character-Driven Scenes this is where it gets good

- go to Freepik
- upload your Shotdeck reference as a style guide
- use their "nano banana" feature to swap elements while keeping composition
- export as high-res
- run it through Seedream 4 at 4K for extra polish

why this workflow destroys Midjourney for characters:

- you get actual control over composition
- character consistency is 10x better
- no fighting with AI interpretation
- colors stay locked in

STEP 4: Final Polish

- check if the image actually tells a story
- make sure the framing matches your shot type
- verify it's 16:9 (VEO requirement)

- save everything organized by project in folders

pro tip: build a library of your best generations so you can reuse angles, lighting setups, and compositions across different clients

VEO 3.1 PROMPTING FRAMEWORK

VEO transforms text into video with audio

the gap between mediocre and exceptional output comes down to two things: how you structure your prompts and which workflow you choose

image-to-video dominates our workflow (90% of projects)

text-to-video is reserved for specific scenarios where image generation isn't practical

AUDIO ENGINEERING

VEO generates audio automatically when you prompt for it

think in four layers: dialogue, ambient noise, sound effects, and music

dialogue approaches:

- explicit: "A guy says: My name is Ben"
- implicit: "A guy tells us his name"

keep dialogue under 8 seconds of actual speech

if you find the character is saying your thing too slow, you can actually just add more words in there

remember veo is working backwards from filling an 8 second frame

adding more words will increase delivery speed (you can always cut it later)

CAMERA CONTROL

VEO understands camera movements exceptionally well

simple prompts work ("zoom in", "pan left"), but professional results require proper terminology

professional camera movements:

- Pan (horizontal rotation)
- Tilt (vertical rotation)

- Push In
- Pull Out
- Zoom
- Dolly Zoom
- Roll
- Tracking
- Arc
- Boom (vertical movement)
- Handheld
- Bird's Eye

for selfie-style POV shots: "A selfie video of [subject], holds the camera at arm's length, arm clearly visible in frame"

pro tip: maintain a custom GPT trained specifically for camera movements. giving claude or chatgpt a lot of system knowledge about filmmaking will actually go really far when making shot lists, storyboards, and your actual video

TEXT-TO-VIDEO (WHEN WE USE IT)

rarely used, but valuable for quick tests, establishing shots, or scenes without specific character requirements

keep prompts straightforward

JSON formatting only for genuinely complex shots - otherwise, it's overkill

IMAGE-TO-VIDEO (PRIMARY WORKFLOW)

this is how we work most of the time

two distinct approaches depending on what you're creating

WORKFLOW 1: Objects & Environments

best for products, landscapes, architecture, abstract scenes - anything without human subjects

1. find reference on Shotdeck
2. reverse engineer prompt with Gemini
3. generate image in Midjourney (16:9, raw style)
4. feed to VEO 3 as image-to-video

WORKFLOW 2: Character-Driven Scenes

for anything involving people, this produces superior results

1. find reference on Shotdeck
2. import to Freepik as reference
3. replace elements with "nano banana" while maintaining composition and color
4. refine in Seedream 4 at 4K
5. generate video in VEO 3.1

the second workflow's advantage: character consistency and control over composition without fighting Midjourney's interpretation

TECHNICAL SPECS & UPSCALING

VEO 3 outputs at 720p, 16:9 aspect ratio by default

for upscaling: topaz remains the best tool, but use at caution as it can make it look cartoonish at times

boost frame rate to 60fps for smoother motion when needed, particularly for action sequences

process order matters: generate at native resolution first, upscale as the final step

PROMPT STRUCTURE TEMPLATE

[Technical specs] [Subject] [Action] in [Context]. [Camera movement] captures [Composition]. [Lighting/ambiance]. [Audio elements]. (no subtitles!)

Spoken lines:
Character: dialogue

You can also use the snubroot veo 3 meta github and upload this to a claude project and let it create prompts for you:

https://github.com/snubroot/Veo-3-Meta-Framework

More sauce:

TOOL STACK SUMMARY

- **Shotdeck** (references)
- **Gemini** (prompt engineering)
- **Midjourney** (objects/scenery images)
- **Freepik + Seedream 4** (character images)

- **VEO 3/3.1** (video generation)
- **Astra** (upscaling)
- **Custom Camera GPT** (professional movements)

the separation between amateur and professional output is knowing which workflow fits your specific shot and executing it cleanly

image-to-video dominates because it gives you control over the starting frame

text-to-video remains useful for quick iterations

use proper camera terminology

trust the physics engine

keep dialogue concise

upscale strategically

THE QUALITY SECRET (8K SHOT

PROMPTING)

here's something most people don't know:

VEO 3 FOLLOWS CAMERA PROMPTING STRUCTURES EXTREMELY WELL the

github framework i mentioned doesn't include 4k or 8k shot prompting by default so

before you send your final prompt to veo 3, you need to add this:

in your claude chat, tell it:

"make sure this scene is shot on a [SPECIFIC 8K CAMERA MODEL] with ultra-detailed 8K

resolution"

have it specify the actual camera - like "RED Komodo 6K" or "ARRI Alexa LF" or "Sony

Venice 8K"

this COMPLETELY changes the output quality

veo 3 understands cinematography language and will adjust the rendering to match that

camera's characteristics

8K SHOT PROMPTING CHANGED EVERYTHING FOR ME

suddenly my videos went from "pretty good" to "wait this looks like a real commercial"

Sora 2 is also another tool that works great and ill be going over this in future guides and my telegram about the insane use cases for this.

BECOMING A REVENUE PARTNER (NOT JUST A VENDOR)

look, you can post the AI videos you make organically and try to get clients like

that but it's not a guaranteed result

the algorithm is unpredictable, views are unreliable, and you can't prove ROI

if you want your clients to actually have results from your AI videos, you need to actually run ads for them and combine this service with marketing

here's the truth: one-and-done AI videos are a commodity

you will be a freelancer forever if that's your game

constantly searching for the next client to pay your rent

your goal is to sign retainers on these AI videos, make sure they're getting results, and ensure the videos are performing well

that's how you actually get paid long term

that's how you stop living project-to-project

here's the brutal truth: most AI filmmakers think just making pretty videos is enough
it's not

your only play is to climb the value ladder

stop being the guy who just delivers videos

become the guy who makes your clients money

THE 4-PART MARKETING FUNNEL

most AI filmmakers only focus on generating attention

that's the lowest value part of the funnel

here's what you need to understand:

1. **generating attention** (what most videographers do)
2. **generating leads** (where you should start)
3. **generating appointments** (where you make real money)
4. **closing sales** (where you become irreplaceable)

the closer you get to the money, the more money you make

sales agencies make millions per month because they operate the whole funnel

you need to get closer to the sale

THE CLIENT CAMPAIGN AUDIT PROCESS

here's our step-by-step framework for making ads that actually

convert: **STEP 1: ANALYZE THE CURRENT OFFER**

is it homework or is it value?

homework = bad:

- "call me for a quote"
- "click to learn more"
- no real incentive

value = good:

- "10% off if you book this week"
- "free [something] with your order"
- "limited time holiday offer"

think about it like this: should a complete stranger go out of their way to click the link down below, fill out their information, and go through the process?

is it worth their time?

if the answer is no, that's homework

and if it's homework, the ads aren't going to perform well

examples of good offers:

- holiday specials (Labor Day, July 4th, etc)
- "Independence Day offer - limited time only get 10% off your new kitchen"
- "exclusive for people watching this ad"
- free upgrades or add-ons

STEP 2: CHECK URGENCY

this is how you tie videos directly to revenue

add urgency to the ads so you can prove that YOUR videos are making them money

how to add urgency:

- "exclusive for people seeing this ad"
- "only available until [specific date]"
- "first 10 people get this bonus"
- tie it to a holiday or event

urgency = immediate action = trackable conversions

this is how you prove your value

organic content doesn't give you this level of control

ads are predictable - you pay x dollars, x people see it, y people convert

STEP 3: ANALYZE THE PAIN ANGLE

can you pull the pain trigger in your ads?

you can't do it with every niche, but when you can, it's powerful

example: hurricane-proof windows in South Florida

- pain: your family could literally die if debris breaks your window during a hurricane
- hook: show a storm, rock comes through window
- urgency: hurricane season is coming
- outcome: life or death decision

other pain-driven niches:

- weight loss (health risks, embarrassment)
- financial services (losing money, bankruptcy)
- home security (break-ins, theft)
- medical (untreated conditions getting worse)

use ChatGPT's deep research feature: "what are the pain points for [specific ICP] in [specific industry]"

test pain-driven ads vs. aspiration-driven ads

see which converts better

STEP 4: COSMETIC VS LIFE-CHANGING

is this a nice-to-have or a need-to-have?

cosmetic:

- new kitchen countertops
- landscaping upgrades
- aesthetic improvements

life-changing:

- hurricane-proof windows
- medical treatments
- emergency home repairs
- pest control

if it's life-changing, lean HARD into consequences of inaction

if it's cosmetic, lean into aspiration and status

STEP 5: AUDIT THE HOOK AND VISUAL

decision A: is the hook scroll-stopping?

you have no idea how many AI filmmakers fuck this up

the first 3 seconds is EVERYTHING

everyone and their mother is running ads nowadays

people are dopamine monkeys
you need scroll-stopping hooks or the ad dies

decision B: does it speak directly to the client's ICP?

this is super important

when you're running ads, the first thing the viewer sees is the visual

then they hear what you say

you see first, then you hear - that's how we interpret things

example:

- selling pool decks for mansions
- option 1: owner standing in front of massive beautiful pool deck at a mansion
- option 2: owner standing in front of an RV home

which one speaks to wealthy homeowners?

obviously option 1

decision C: do visuals match ICP preferences?

- **high-end service:** polished, professional imagery
- **blue-collar service:** authentic, relatable
- **emergency service:** urgency-driven visuals

attention to detail is everything

your ads need to LOOK like they're for the right audience

STEP 6: IMPLEMENT ALL FOUR ELEMENTS

make sure your ad has:

1. valuable offer (not homework)
2. clear urgency mechanism
3. pain or aspiration angle
4. scroll-stopping hook + ICP-matched visuals

STEP 7: TEST AND MEASURE RESULTS

we test ads really quickly

we know when one's not working
when one's not working, we spin off a completely different ad with different messaging, maybe different visuals

our testing system:

- collect massive amounts of B-roll from clients (or have them record on iPhone)

- Or generate them with ai, sora 2 works really good for broll

- use 11 Labs to clone their voice or create AI voiceover
- test different scripts with the same B-roll
- test different visuals with the same script
- find winners, scale them

we're basically just testing scripts and offers using AI voiceovers

it's the easiest way to test ads

you need to leverage AI or AI will replace you

KEY METRICS TO WATCH

for paid ads, there's mainly one metric we watch:

unique outbound clicks (as % of impressions):

- below 1% = kill campaign
- above 1% = it's good
- above 2% = it's really good
- above 3% = fucking great, scale it

THE RAPID TESTING FRAMEWORK

here's the hack:

whenever you have a project with clients, get a bunch of B-roll

Or generate with sora 2

like a bunch of it

even if they have their own B-roll, or tell your clients to literally place their iPhone on a tripod, record a bunch of videos, and send you the B-roll

then:

1. clone their voice using 11 Labs (AI voice software)
2. or make your own voice using AI
3. use all the B-roll + ai system to create ads
4. test scripts and offers with AI voiceover

if you guys want more on this let me know because it's the easiest way to test ads
we leverage a lot of AI inside our company

you need to use it to climb the value ladder

it's never been easier because of AI

POSITIONING AS A REVENUE PARTNER

the difference between making $2k/month and $15k/month is simple:

vendors deliver videos and pray they work

partners deliver revenue and prove it

when you can prove that your videos directly generate leads, appointments, and sales, you become irreplaceable

that's the power of running ads vs just posting organically

with ads, you can actually track and prove ROI

the way you prove it:

- add urgency to every ad
- track conversions with UTM parameters
- show them the dashboard
- "these 47 leads came from THIS video"
- "this campaign generated $23k in revenue"

suddenly you're not an AI filmmaker anymore

you're a growth partner

and growth partners don't get fired when budgets tighten

they get more budget

this is how you sign retainers

this is how you stop living project-to-project

this is how you build an actual business instead of being a freelancer forever

THE COMPLETE TOOL STACK

image generation:

- Shotdeck (reference library)
- Gemini (prompt analysis)
- Midjourney (objects/environments)
- Freepik (character consistency)
- Seedream 4 (image upscaling)

video generation:

- VEO 3/3.1

- sora 2
- Astra (video upscaling)
- Custom Camera GPT (shot planning)

audio:

- 11 Labs (voice cloning + AI voices)
- VEO 3's built-in audio generation

project management:

- Figma (organize all work)
- notion (client deliverables tracker)

ad management:

- Meta Ads Manager
- TikTok Ads Manager
- Google Analytics (conversion tracking)

FINAL NOTES

the biggest opportunity in 2025 is that small players now have the same shot at virality as billion-dollar brands

the money won't just flow to big agencies anymore

it'll flow to creators who know how to structure a story

ads built with absurd characters, sharp edits, and scripts that feel like short films are printing right now

with AI you can now make content so strange and so scroll-stopping that it's hard to miss

the crazier the imagination, the higher the ROI

stop being a vendor
become a revenue partner

use this blueprint to print
